

Connect one beam splitter to each side

In optical communication networks, optical splitters play a crucial role in efficiently dividing and distributing signals. Proper placement and usage are essential for optimizing signal ...

When you need to separate or overlap two beams on the optical bench or in a product design, the solution is most often the humble but elegant beamsplitter. In this tech note, we'll look at the types of ...

This design is extremely flexible, allowing one to use different fiber types on different ports, and different beam splitter optics inside. Custom designs combining circulators, polarizing splitters and non ...

Beamsplitters are usually made as a reflective device that splits the beam into exactly 50/50 with half of the beam being transmitted and the other half being reflected. If this component is ...

Plate beamsplitters are flat substrates with a partially reflecting coating on one surface that divides the optical beam based on power or wavelength. No epoxy or optical contacting is used in fabrication, ...

A diffractive beam splitter can generate either a 1-dimensional beam array (1xN) or a 2-dimensional beam matrix (MxN), depending on the diffractive pattern on the element.

A beam splitter is an optical device that divides an incoming light beam into two separate beams. One beam is typically reflected while the other is transmitted.

One possible orientation is engraved on the top of the cage cube. Each beamsplitter cube is epoxied within the cage cube mount and cannot be removed from the mount. We also offer empty 30 mm ...

In this blog, we will explore the step-by-step process of using a beamsplitter cube effectively, along with some common applications that benefit from this powerful optical tool. Step-by ...

In this guide, we'll explain how to safely connect a splitter to another splitter, covering both fiber optic and coaxial setups.

Thorlabs' Single Mode Fiber-Based Polarization Beam Combiners (PBC) or Splitters are designed to either combine two orthogonal polarizations into a single fiber or ...

Another common approach, particularly for linearly polarized laser beams, involves the combination of a rotatable half-wave plate and a polarizing beam splitter.

Connect one beam splitter to each side
