

High-density wholesale of hot aisles in computer rooms

Hot aisle containment in data centers can double the cooling capacity & increase data center efficiency by 30% or more. [Learn more here!](#)

Implementing hot aisle containment (HAC) within data centers is a robust approach to airflow management, ensuring the efficient redirection of hot air from server racks towards cooling ...

Last week we continued our article series on the challenges of keeping IT equipment cool in high density environments. This week, we outline some potential containment solutions.

Airedale experts can help you take advantage of the latest aisle containment and IT cooling technology to deliver high performing, high efficiency, low PUE data centres.

This method encloses the hot air exhaust aisle, preventing it from mixing with cold supply air. It requires a specific ceiling design and is therefore ...

Learn hot aisle containment basics, benefits, and implementation. Reduce cooling costs 43% and improve data center efficiency with our complete guide.

The increasing cooling demand in high-density DC data centers, where the power, complexity, and thermal density of racks have surpassed the capabilities of traditional CRACs needs ...

Learn how data center containment systems support high-density performance with reliable and efficient cooling.

This method encloses the hot air exhaust aisle, preventing it from mixing with cold supply air. It requires a specific ceiling design and is therefore better suited for new builds rather than retrofits.

If the hot aisle temperature is high enough, this air can be used as a heat source in many applications. In addition to energy savings, higher equipment power densities are also better supported by this ...

Higher Efficiency and Density Support: HAC can handle higher server densities by maintaining consistent intake temperatures and reducing bypass airflow, often leading to energy ...
