

# Is the head unit DC or AC

Identify and prepare the stereo head unit's power connectors. Like most direct current (DC) powered electronics, the car stereo should have two power lead wires: one positive (usually red) and one ...

&quot; Each of the audio outputs channel circuits (+) and (-), at the radio have a DC bias voltage that is approximately one half of the battery voltage. The audio being played on the system is ...

Interpreting the DC and AC voltage test results provides a clear diagnosis of the head unit's status. The most definitive result is the detection of high DC voltage, which immediately ...

Automotive system designers have basically two alternatives when selecting the best audio amplifier for their automotive head-unit systems: Class-AB or Class-D.

We'll be talking about supplies that take the 120-volt AC power from the wall and convert it to something like 13.6-volt DC to power car audio equipment. A simple block diagram of a linear ...
