

Negative readings from optical power meter

In most fiber networks, the light signal is very weak -- often weaker than a small flashlight. When this happens, the power meter shows a negative number in dBm. The signal has ...

But because of convention, we sometimes drop the signs when we report the values because loss always means the optical power measurement was negative and gain means the optical power ...

You can detect high splice loss by using both your optical power meter and an OTDR (Optical Time Domain Reflectometer). If your power meter shows a reading below -28 dBm, suspect ...

When there's loss in a fiber optic system, the measured power is less than the reference power, resulting in a negative logarithmic value and a negative dB reading on the meter. Despite the meter ...

One of the most common mistakes made is remembering to clean the sensor. Dirty sensors can compromise measurement accuracy leading to incorrect information. At last, ...

A reading of 0 dBm equals exactly 1 milliwatt of optical power. Negative numbers mean less than 1 milliwatt: -10 dBm is 0.1 milliwatts, -20 dBm is 0.01 milliwatts, and so on.

We checked and the TIA and IEC standards for measuring power, FOTP-95, still defines dBm this way. That's good, because we're used to negative dBm being power smaller than 1mW and positive dBm ...

By Mark Slutzki / March 18, 2026 English A negative reading on a laser power meter can be confusing during laser measurements. After all, lasers produce positive optical power, so how ...

This negative reading is normal and indicates the expected passive loss of light over distance and through network components. The difference between transmitted and received power, expressed in ...

Laser power meter negative reading? Discover causes like thermopile thermal imbalance, beam spillover, and how to fix measurement errors fast.
