

OTN--or Optical Transport Network--is a telecommunications industry standard protocol-- defined in various ITU Recommendations, such as G.709 and G.798 --that provides an efficient way to ...

An Optical Transport Network (OTN) refers to an interconnection of optical switches and optical fiber links that transmit data over a lightwave-based channel. It is a layer one network that uses various ...

The aim of the optical transport network (OTN) is to combine the benefits of SONET/SDH technology with the bandwidth expandability of DWDM. In short, OTNs will apply the operations, administration, ...

Network operators worldwide are looking to 100G optical transport technologies to address unprecedented growth in bandwidth demands driven by Big Data and continued growth in mobile ...

Ribbon's Apollo OTN switching solutions deliver granular, end-to-end control over client services and maximizes wavelength capacity with 400G everywhere.

OTN is defined by the ITU as a method to efficiently encapsulate, transport, multiplex, and switch a wide range data and legacy services over optical wavelengths.

Ribbon's Apollo OTN switching solutions deliver granular, end-to-end control over ...

An optical transport network (OTN) is a digital wrapper that encapsulates frames of data, to allow multiple data sources to be sent on the same channel. This creates an optical virtual private network ...

Also commonly called "digital wrapper," OTN--or Optical Transport Networking--is a next-generation, industry-standard protocol that provides an efficient and globally accepted way to multiplex different ...

OTN is the dominant traffic management technology for optical networks, embedded in nearly nine out of every ten optical network devices sold.

Operators using circuit-switched technology (such as optical transport network or OTN) need to allocate fixed-capacity circuits to transport packet-switched traffic, which results in "stranded" capacity on ...
