

Small sample clamping distance in spectrometer

In general, if you need a compact spectrometer you should aim for a short detector (typically 1/4" or 6.4 mm). However, if you require a broad spectral range and/or a high resolution you should aim for a ...

The extensive PV program aimed at optimising the AOT parameters led to ramps of 32 samples, i.e. 1/8 second, for all all spectrometer AOTs. The scientific signal corresponds to the slope of these ...

To accomplish this, unlock the fine control clamp (lower left, toward the rear) and rotate the grating table by hand until the vernier is near the desired value (90 degrees, 270 degrees, or some other ...

Mount the prism (in holder) on the dowel pins (in the prism table) so that the prism is far enough from the collimator that beams B and B are centered with respect to the spectrometer axis; otherwise much of ...

In an effort to make spectrometers more suitable for sample-limited applications, we developed a low-volume analyzer capable of measuring mole fractions of methane and carbon ...

Cost effective SEM clamp sample holders which are specifically designed to hold thin wires, tubes, needles, probes and strips of material to enable easy imaging of the surfaces

I am facing challenges in coupling light from a very small source, 1 mm in size, into a spectrometer. The spectrometer is about 660 mm long, Czerny-Turner geometry, with grating size ...

The invention can better solve the problem that small-sized and irregular samples cannot be detected in the direct-reading spectrum, and reduces the requirements on the shape and size of the...

Time of Flight Mass Spectrometry Guide Time of flight mass spectrometry measures how long ions need to cross a known field free path. The idea is simple. Light ions travel faster. Heavy ions travel slower. ...

Set up the spectrometer on a circular wooden stand and one of the Sodium lamps on one of the thinner square pieces of wood. The slit of the spectrometer should fit neatly into the aperture on the lamp.

This paper presents a low-cost clamp to capture spectral leaf signatures in the laboratory and the field. The clamp can be 3D printed using PLA (polylactic acid); it allows the connection of 2 ...

This spectrometer has interchangeable gratings and a micrometer screw to change the wavelength range. A fresh calibration must be performed when a grating is changed or the ...
