High-power vertical-cavity surface-emitting lasers can also be fabricated, either by increasing the emitting aperture size of a single device or by combining several elements into large two-dimensional ...

Vertical cavity surface emitting laser (VCSEL) is a type of semiconductor laser diode that generates a laser beam perpendicular to the surface, as opposed to edge-emitting laser diodes, which emanate ...

Overview Characteristics Production advantages Structure Applications History See also External links Because VCSELs emit from the top surface of the chip, they can be tested on-wafer, before they are cleaved into individual devices. This reduces the fabrication cost of the devices. It also allows VCSELs to be built not only in one-dimensional, but also in two-dimensional arrays. The larger output aperture of VCSELs, compared to most edge-emitting lasers, produces a lower divergence angle of the output beam, and makes possible high coupling efficiency with optical fibers.
